June 6, 2019 Name: Micah Hayden Page 1 of 4

1 [45 Points] The following *cipherText* was constructed using RSA public key. Obtain the English plaintext message using the Chinese Remainder Theorem.

e = 65537

p = 746918102493791635978193561925721521389032052060112172075459444248371637125882659108701788279703935010162590693536046065401333607946984763846634871796116399582170704067630484997638162565246552787306576758309867263060874477

June 6, 2019 Name: Micah Hayden Page 3 of 4

The plaintext is shown below:

Alan Turing, in full Alan Mathison Turing, (born June 23, 1912, London, England-died June 7, 1954, Wilmslow, Cheshire), British mathematician and logician, who made major contributions to mathematics, cryptanalysis, logic, philosophy, and mathematical biology and also to the new areas later named computer science, cognitive science, artificial intelligence, and artificial life.

2 [45 Points] Digital Signature Algorith (DSA)

2.1 Generate a DSA Key pair such that $p \ge 1024$ bits and $q \ge 160$ bits. Hint: find a prime $q \ge 160$ bits, then find a random number $tmp \ge (1024\text{-}160)$ bits and conduct primality testing of $q \cdot tmp + 1$ to find p.

 $\begin{array}{l} p = 1000185314377849423220238460202431364209480565309682308436606983712191687567331814439248182475457\\ 159101991464795414823583991847404173791783415330490613084253134064275998560532388560037678374350401169\\ 91532742915432433838946936538252018217613988216084728043202339\\ q = 1020075474687528267148368281341911216071243953321 \end{array}$

2.2 Identify Public Key parameters

The public key parameters include p and q, shown above. The other public parameters are the generator $\alpha=7044047615806015039114401546737569688500396056513589270585508679910579997583238089311292891813743 742991848448332086731499878679817065038602124044779942197026772908013904468818108208274807032914714361 0544032074233752112468299815726640604586730154256433204644050$

 $\beta = 28868565430922019260273536154542033165691642253684781128220334958079416225855590879250670937820327158741157629854344645824096075192444762327829721402032415913486090823611412441878261444329952625008602068719970588284018296874802225004304701231907598704800003714$

2.3 Generate Signature for MD5-Hash = 120654484320263588514608261628026439285

The signature for the hash above is calculated using the following equation:¹

- 1. Choose an ephemeral key $0 < k_e < q$
- 2. Compute $r \equiv (\alpha^{k_e} \mod p) \mod q$
- 3. Compute $s \equiv (h(x) + d \cdot r) \cdot k_e^{-1} \mod q$

This gave the following value for s: s = 2353824429486618614115811796225167027159380760

2.4 Verify the Digital Signature Generated in 2.3

The signature verification is calculated as follows:

- 1. Calculate $w \equiv s^{-1} \mod q$
- 2. Calculate $u_1 \equiv w \cdot H(x) \mod q$
- 3. Calculate $u_2 \equiv w \cdot r \mod q$
- 4. Compute $v \equiv (\alpha^{u_1} \cdot \beta^{u_2} \mod p) \mod q$

The signature is accepted if $v \equiv r \mod q$.

v = 846892599428079868038963491135011001632698818035

r = 846892599428079868038963491135011001632698818035
